

# MODELLING SUCCESS IN THE NFL

Elliott Scott

# OVERVIEW

- Goals of Project
- The Data
- Modelling
- Conclusion

# GOAL OF PROJECT

- Develop a model that evaluates the performance of an NFL team.
- Compare performance based on different levels of success.

# WHAT IS SUCCESS IN THE NFL

- 1 out of 32 teams wins Super Bowl every season
- Not a good measurement for analysis
- How do the other 31 teams know what they need to improve?
- Teams should create easier, more incremental goals.

# SUCCESS TARGETS

- More easily reached
- Incremental
- Success Targets:
  - .500 Record
  - Making the playoffs
  - Winning Super Bowl

# EVALUATING PERFORMANCE

- What level of performance does a team need to reach the a success targets?
- Three most useful performance metrics
  - Wins
  - Points scored
  - Points conceded

# THE DATA

Variable	Class	Description
team_name	character	Team name
year	integer	Season year
wins	double	Wins (0 to 16)
points_for	double	points for (offensive performance)
points_against	double	points for (defensive performance)
playoffs	character	Made playoffs or not
sb_winner	character	Won Super Bowl or not

# MODELLING .500 TEAMS

There is strong evidence to suggest:

- Every touchdown scored increases the odds of a team having a .500 and above record by 28%
- Every touchdown conceded decreases the odds of a team having a .500 and above record by 28%

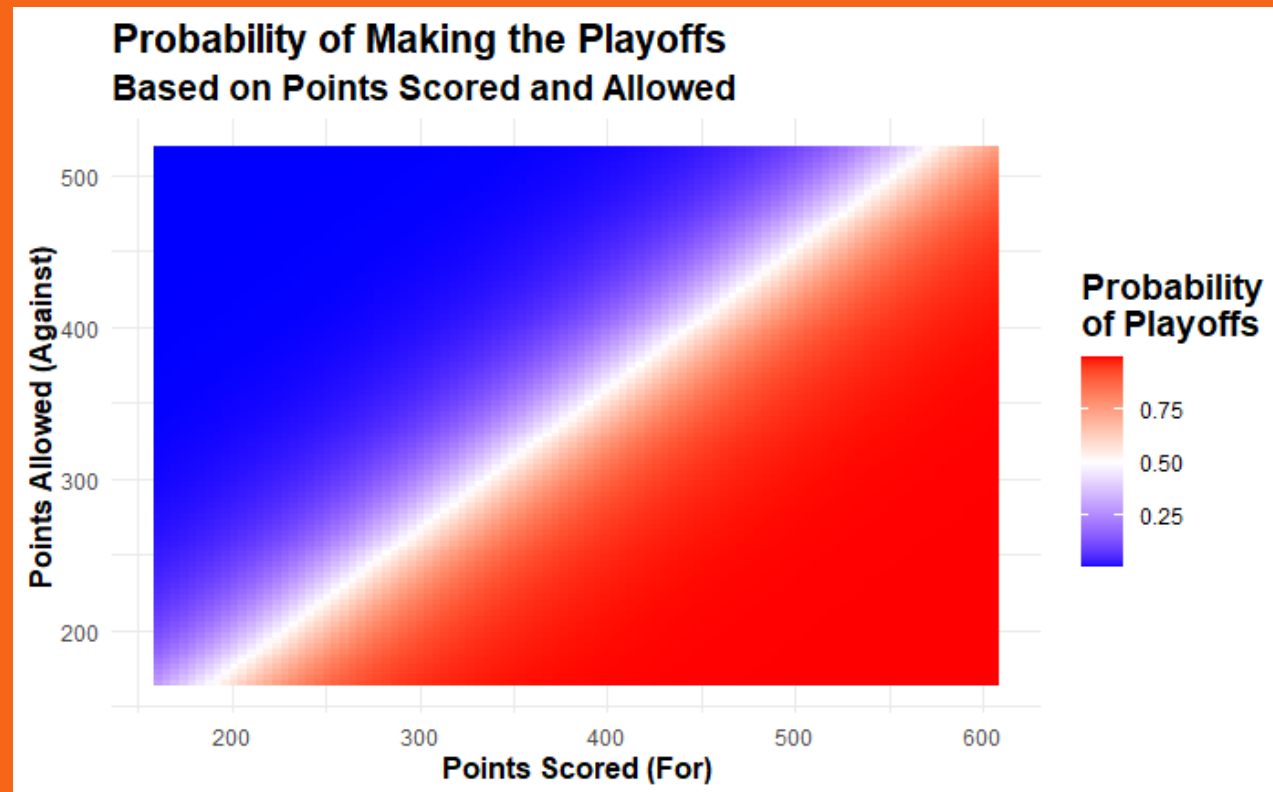

# MODELLING PLAYOFF TEAMS

There is strong evidence to suggest:

- Every touchdown scored increases the odds of a team making the playoffs by 21%
- Every touchdown conceded decreases the odds of a team making the playoffs by 21%

# MODELLING SUPER BOWL TEAMS

There is strong evidence to suggests:

- Every win increases the odds of a team winning the Super Bowl by 55%

# MODELLING SUPER BOWL TEAMS

There is some evidence to suggests:

- Every touchdown scored increases the odds of a team winning the Super Bowl by 0.7%

# MODELLING SUPER BOWL TEAMS

There is some evidence to suggests:

- Every touchdown conceded decreases the odds of a team winning the Super Bowl by 7%

# MODELING PLAYOFF TEAMS VS SUPER BOWL WINNING TEAMS

- There is no evidence to suggest that:
  - A difference in points scored influences the probability of winning the Super Bowl

There is some evidence to suggests:

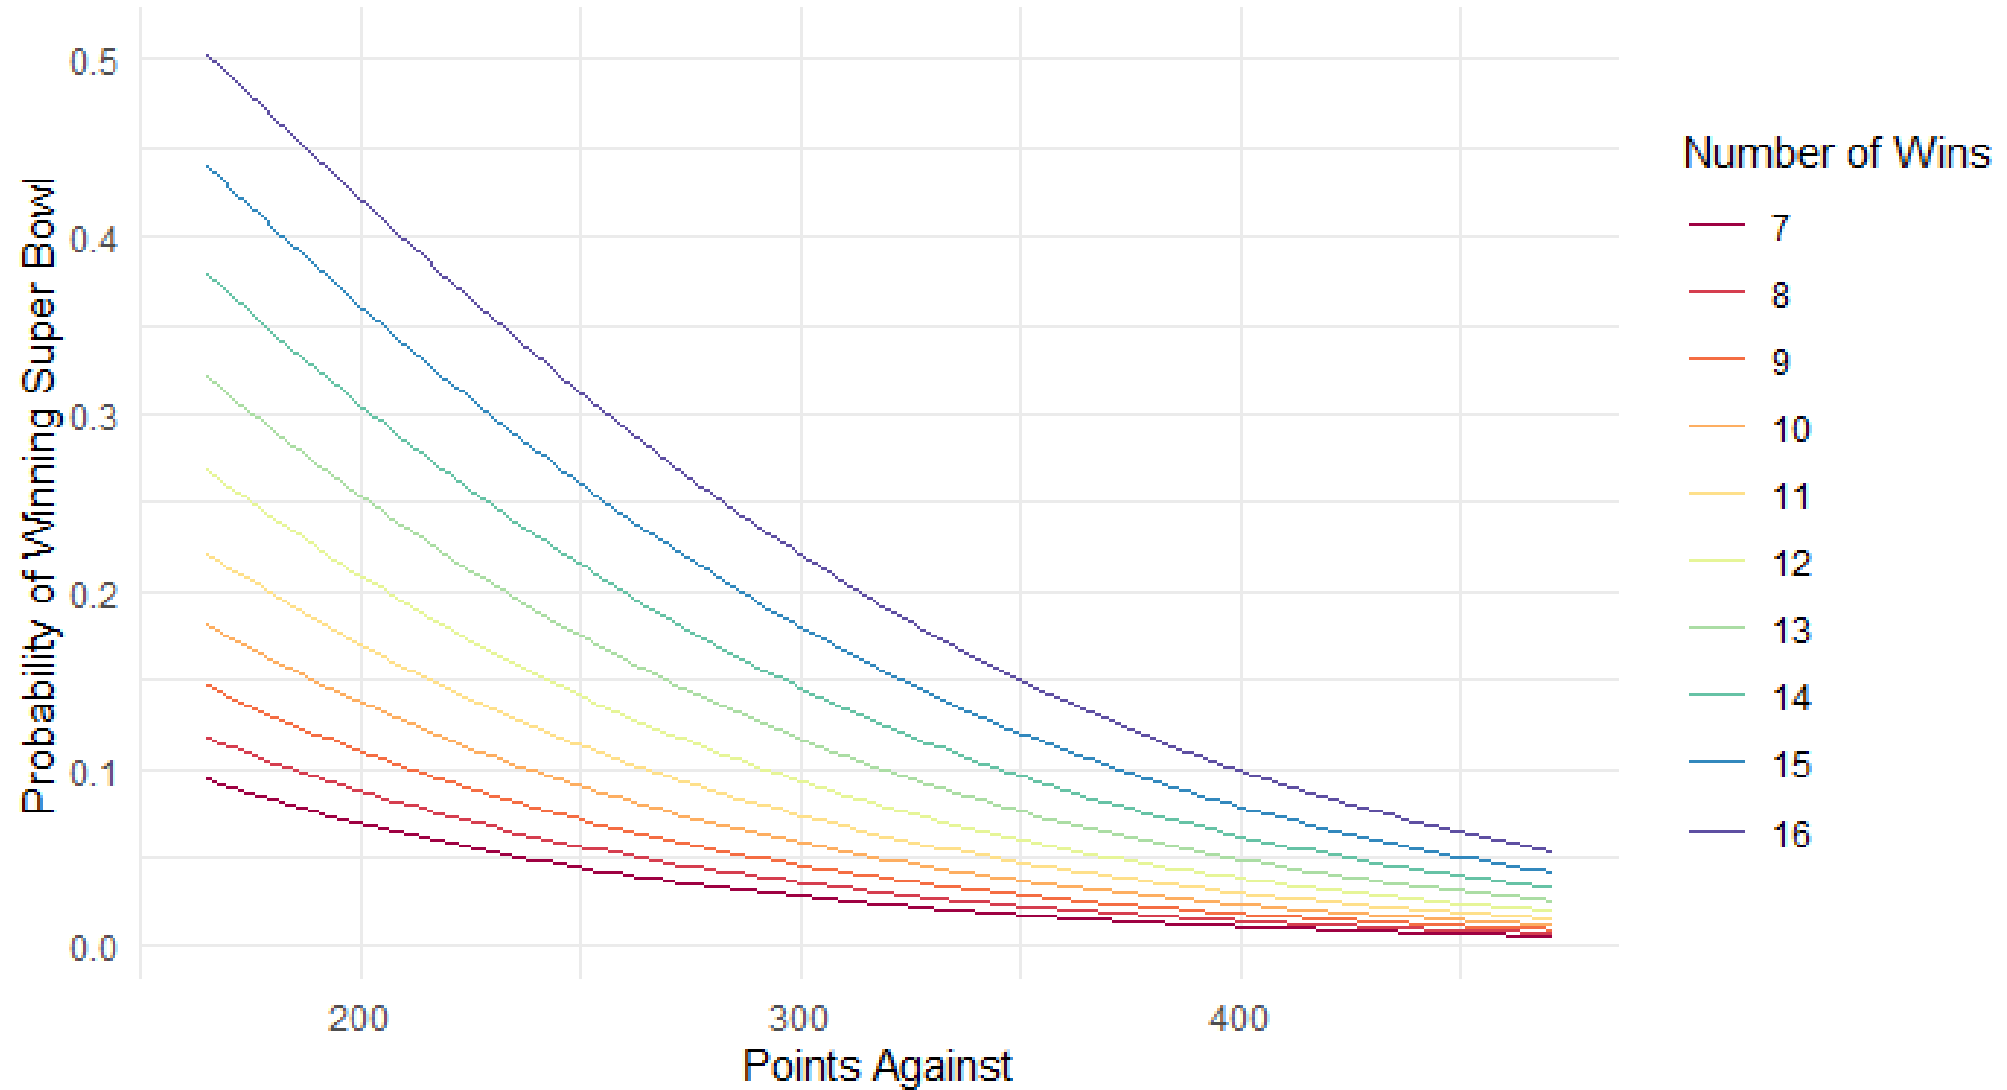

- Every win increases the odds of a playoff team winning the Super Bowl by 29%

There is strong evidence to suggests

- Every touchdown conceded decreases the odds of a playoff team winning the Super Bowl by 0.7%

## Probability of Playoff Teams

Winning the Super Bowl by Points Against and Wins

# CONCLUSION

- Key Findings:
  - Points scored and conceded significantly influences NFL success.
  - Additional wins dramatically increase Super Bowl winning chances.
- Implications:
  - Useful for setting performance goals and training priorities.
- Future Directions:
  - Include more variables on player data and game conditions.
