Elliott Scott

Software developer and data scientist | Applied AI and analytical applications

Phoenixville, PA | elliottscott774@gmail.com | 443-686-2059
elliottscott774.github.io | www.linkedin.com/in/elliottscott774

Software developer, data scientist, and Developer Lead who builds applications, AI systems, and analytical tools. Uses Python, SQL, React, and TypeScript to turn data into working software. Leads three developers while continuing hands-on engineering at Keystone Sports Construction. M.S. in Applied Data Science and B.S. in Computer Science.

Technical skills

Programming and data: Python, R, SQL, TypeScript, JavaScript, pandas, NumPy, PostgreSQL, SQLite

Modeling and applications: PyTorch, TensorFlow/Keras, scikit-learn, Plotly, Streamlit, Shiny, React, Node.js

Cloud and engineering: AWS S3, ECS Fargate, Docker, GitHub Actions, Playwright, pytest, Vitest

Current experience

Keystone Sports Construction Aug 2025 to present

Developer Lead

Keystone builds athletic fields and other sports facilities. Joined as the company's sole developer and AI Specialist. Promoted to Developer Lead in May 2026. Helped hire and now lead three other developers while continuing hands-on engineering.

Intelligent Prospecting and LM Navigator

- Designed and built an automated AI platform that collects documents from publicly available board meetings, identifies sports facility construction opportunities, and delivers findings with source evidence to HubSpot. Intelligent Prospecting runs daily across thousands of companies.
- Built LM Navigator with controlled Playwright actions and repeatable test sets. Analyzed the website types where it struggled and developed targeted instructions that increased its success rate to over 80%. Connected collection and analysis to PostgreSQL, S3, and scheduled AWS ECS Fargate execution.

Court and Field Designer

- Created an interactive sports facility designer with React and SVG. Users configure layouts, dimensions, materials, markings, text, and logos, preview a design, and request a purchase quote.
- Implemented shared design state, saved designs, and quote-request details with a Node.js and Express API. Connected user choices in the interface to the information needed for sales follow-up.

Prevailing wage application

- Built a Windows wage-data application covering multiple states with Python scrapers, a Svelte interface, and a Tauri/Rust backend. Normalized source records into SQLite with effective dates, history, refresh, and exports. Integrated Microsoft sign-in and desktop data management.

Meeting recorder and summaries

- Built a Python and Flet application for audio capture, transcription, and automatic meeting summaries. Added asynchronous processing, ordered transcript assembly, versioned notes, and optional Obsidian export using usage-based OpenAI APIs.

Engineering leadership

- Set up GitHub Enterprise and led repository migration. Advocated Linear adoption for project tracking and coordinated shared source control and review practices.
- Helped establish agentic engineering through company software projects, with isolated environments, developer review, and automated validation.

Elliott Scott

Software developer and data scientist | Applied AI and analytical applications

Graduate analytics experience

Indiana University Indianapolis 2024 to 2025

- Collaborated with IU Indianapolis Soccer on a Python performance analytics platform. Built a Dockerized Streamlit and Plotly application with AWS S3 data ingestion and separate shooting, player-tracking, and team-comparison modules for coaching analysis.
- Worked with NCAA LiveStats to build an interactive R Shiny college-football application for win-probability and play-type analysis. Translated play-by-play data into views and metrics and recommended additions to future data collection.
- Analyzed more than 300 sports technology companies with SportsTechHQ. Combined CRM, behavioral, and demographic data to investigate factors associated with partnership agreements and explain the findings to stakeholders.

Earlier professional experience

Booz Allen Hamilton 2021 to 2023

Data Science Consultant

- Analyzed TCP network traffic and built a Python system to create a structured dataset of the different components observed in that traffic.
- Responded to stakeholder data requests, created visual dashboards, and presented monthly technical findings to leadership.
- Managed procurement tracking and prepared status reports for contract stakeholders.

U.S. Army NBC Battle Lab Summers 2018 and 2019

Research Intern | Aberdeen Proving Ground (APG)

- Built an electric-drone battery prediction system using principal component analysis and linear regression to estimate battery endurance.
- Developed radio-equipment testing scripts and protocols, analyzed performance with Wireshark, and documented results in technical reports.
- Created custom drone component schematics using SolidWorks and OpenSCAD.

Selected academic and independent projects

Deep learning author classifier

Trained a bidirectional LSTM in PyTorch on Project Gutenberg text to identify authors. Built a Streamlit application for text preparation and model inference.

Soccer network and spatial analysis

Analyzed StatsBomb passing events with network and Voronoi spatial methods. Combined spatial dominance, passing volume, and forward progression in a metric for studying players who connect phases of play.

Education

M.S. Applied Data Science, Sports Analytics specialization

Indiana University Indianapolis | May 2025

B.S. Computer Science

Towson University | December 2020
